

## Product Overview

The NSD8310 is a multi-channel half-bridge driver for automotive applications including HVAC flap DC motors, side mirror adjustment / fold motors, general relays, or other LEDs.

With the different connection configuration of half-bridge power stage outputs, the device can drive DC motors in simultaneous, sequential, or parallel mode. The outputs also support DC motor in forward, reverse, slow decay, and fast decay operation.

The device includes 10x internal configurable PWM generators, which allow for flexible control for LED dimming or motor current limitation during start up or stall condition.

The integrated serial peripheral interface (SPI) controls all outputs and provides diagnostic information including normal operation, POR, VM undervoltage/overvoltage, overcurrent, over temperature protection and open load status.

The device features sleep mode with low quiescent current when EN input is low or VDD falls below POR threshold.

## Applications

- HVAC DC motors
- Side mirror adjustment and mirror fold
- Relays
- LEDs

## Device Information

Part Number	Package	Body Size
NSD8310-Q1HTSXR	HTSSOP24	7.80mm x 4.40mm
NSD8310A-Q1HTSBR	HTSOP24	8.65mm x 3.90mm

## Key Features

- 10x half bridge driver
  - 1A per HB channel
  - 6A max for all channel all on
  - Half bridge output can be in parallel
- Wide 4.5V to 36V (configurable) operating Voltage
- Very low quiescent sleep mode
- PWM mode with internal PWM generation on each channel
  - 4 PWM frequency options: 80/100/200/2000 Hz
  - Duty cycle 8-bit resolution (1/255, ~0.4 % duty)
- Integrated diagnosis and fault protection features
  - VM undervoltage & overvoltage protection (UV&OV)
  - Overcurrent / short circuit Protection (OCP/SCP)
  - Over temperature warning & shutdown
  - Open load diagnosis
  - Dedicated nFault indicator pin
- HTSSOP24, 7.8mm X 4.4mm with exposed PAD
- HTSOP24, 8.65mm x 3.9mm with exposed pad option
- AEC-Q100 Grade1 Qualified
- RoHS & REACH Compliance

## Functional Block Diagrams

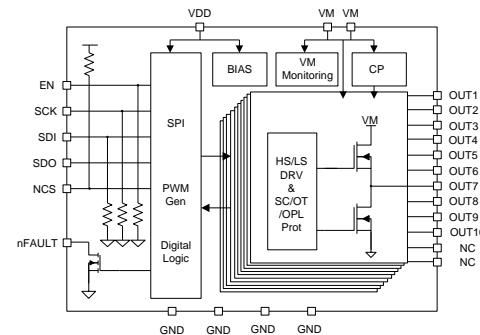

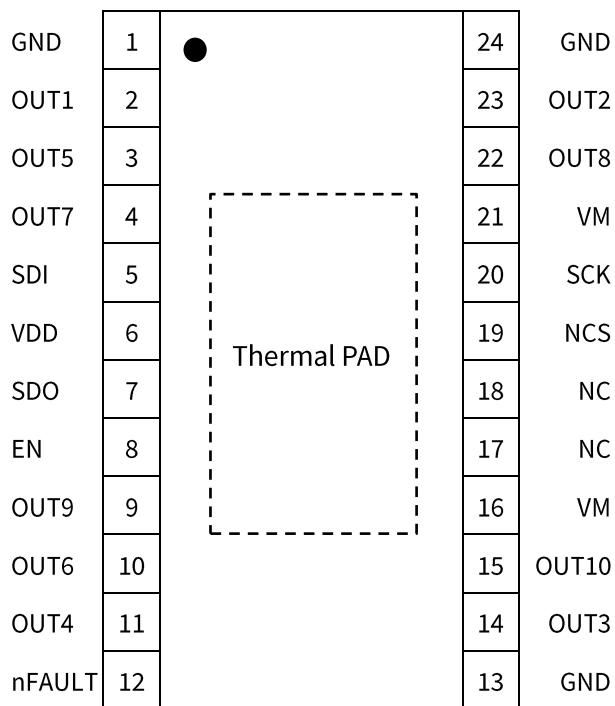

Figure 1. NSD8310 Block Diagram

## 1. Pin Configuration and Functions

**Figure 2. NSD8310 Pinout**

**Table 1. NSD8310 Pin Description**

Symbol	No.	Type	Description
GND	1,13, 24	PWR	Pins for ground connection, all ground pins should be externally connected together.
OUT1	2	O	Half-bridge output1 pin.
OUT5	3	O	Half-bridge output5 pin.
OUT7	4	O	Half-bridge output7 pin.
SDI	5	I	SPI data input pin
VDD	6	PWR	Logic supply input pin,
SDO	7	O	SPI data output pin
EN	8	I	Driver enable input pin with internal pull down (active HIGH). If EN input pin is pulled low, all OUTx go to tri-state and device move to low-power sleep state.
OUT9	9	O	Half-bridge output9 pin.
OUT6	10	O	Half-bridge output6 pin.

OUT4	11	O	Half-bridge output4 pin.
nFAULT	12	O	Fault alert indicator output (active LOW). Open drain structure requires external pull up resistor, typical 4.7Kohm can be used.
OUT3	14	O	Half-bridge output3 pin.
OUT10	15	O	Half-bridge output10 pin.
VM	16,21	PWR	5V to 36V power supply. Connect a 0.1- $\mu$ F bypass capacitor to ground, as well as sufficient bulk capacitor (>10 $\mu$ F) needs to guarantee VM pin voltage in maximum range. Put the 0.1 $\mu$ F and bulk capacitor (>10 $\mu$ F) close to the VM pin. Two VM pins should be externally connected together.
NC	17,18	-	Not connected
NCS	19	I	SPI chip select input pin.
SCK	20	I	SPI clock input pin.
OUT8	22	O	Half-bridge output8 pin.
OUT2	23	O	Half-bridge output2 pin.
Thermal PAD	—		Thermal pad. Connect to board ground. For good thermal dissipation, use large ground planes on multiple layers, and multiple nearby vias connecting those planes.

## 2. Absolute Maximum Ratings

Symbol	Parameter	Min	Max	Unit
VM	Power supply voltage	-0.3	40	V
VDD	Logic supply voltage	-0.3	6	V
$V_{SDI}$ , $V_{SDO}$ , $V_{NCS}$ , $V_{SCK}$ , $V_{EN}$ , $V_{nFAULT}$	Logic input/output voltage (EN, SDI, SDO, NCS, SCK, nFAULT)	-0.3	VDD+0.3	V
$V_{OUTx}$	Output voltage (OUTx) DC condition	-0.3	40	V
	Output voltage (OUTx) AC condition, $I_{out}=1A$ for $t<500ms$	-1	40	V

## 3. ESD Ratings

Symbol	Parameter	Value	Unit
VESD_HBM	Human Body Model (HBM), VMx & VOUTx pins per ANSI/ESDA/JEDEC JS-001	$\pm 4000$	V
	Human Body Model (HBM), other pins per ANSI/ESDA/JEDEC JS-001	$\pm 2000$	V
VESD_CDM	Charged device model (CDM), Corner pins, per JEDEC specification JS-002	$\pm 750$	V
	Charged device model (CDM), other pins, per JEDEC specification JS-002	$\pm 500$	V

## 4. Recommended Operating Conditions

Symbol	Parameter	Min	Typ	Max	Unit
VM	VM supply, normal voltage range	4.5		18	V
	VM supply, extended voltage range <sup>(1)</sup>	18		Vov	V
	VM supply, over voltage range <sup>(2)</sup>	Vov		40	V
VDD	VDD supply voltage	3		5.5	V
EN, NCS, SCK, SDO, SDI, nFAULT	Logic input / output voltage	0		5.5	V

(1) Device is capable of full functional operation; however, parameter characteristic is not guarantee, deviation is possible.

(2) No damage to device, and power stage will be disabled during overvoltage range. Full functional operation will resume when battery voltage returns to normal voltage range.

## 5. Thermal Information

Symbol	Description	Min	Typ	Max	Unit
T <sub>a</sub>	Ambient operating ambient temperature	-40		125	°C
T <sub>j</sub>	Junction temperature	-40		150	°C
T <sub>stg</sub>	Storage temperature	-65		150	°C
R <sub>thjc</sub>	Thermal resistance, junction to case		2.7		°C/W
R <sub>thja</sub>	Thermal resistance, junction to ambient, on 2-layer PCB		62		°C/W
	Thermal resistance, junction to ambient, on 4-layer PCB based on JEDEC standard		30		°C/W

## 6. Electrical characteristics

T<sub>j</sub> = -40°C to 150°C, VM=4.5V to 18V, VDD=3.0 to 5V, unless otherwise specified.

Symbol	Parameter	Test conditions	Min	Typ	Max	Unit
<b>POWER SUPPLY (VM)</b>						
I <sub>VM</sub>	VM operating supply current	VM = 13.5V, EN=HIGH, all high side on			5	mA
I <sub>VM_SLEEP</sub>	VM sleep current	VM = 13.5V, -40≤T <sub>j</sub> ≤85°C, EN=LOW, total current of all VM pin			6	µA
V <sub>UV</sub>	VM undervoltage threshold	VM falls until UVLO triggers	3.6		4.3	V
		VM rises until operation recovers	3.9		4.6	V
V <sub>UV_HYS</sub>	VM undervoltage hysteresis			400		mV
t <sub>uv</sub>	VM undervoltage deglitch time	Guaranteed by digital scan		10		µs
V <sub>OV</sub>	VM overvoltage	VM increasing, switch off, OVP_H = 0	22		26	V
		VM decreasing, switch on, OVP_H = 0	20		24	V
		VM increasing, switch off, OVP_H = 1	32		37	V
		VM decreasing, switch on, OVP_H = 1	31		35	V
V <sub>OV_HYS</sub>	VM overvoltage hysteresis			2		V

$t_{ov}$	VM overvoltage deglitch time	Guaranteed by digital scan		10		$\mu\text{s}$
<b>VDD SUPPLY INPUT (VDD)</b>						
$I_{VDD}$	Input current of VDD	EN=High, all outputs off, SPI not active			5	mA
		EN=High, SPI active 5MHz, all high side on			5	mA
$I_{VDD\_SLEEP}$	Input current of VDD in sleep mode	EN=LOW, SPI inactive $-40 \leq T_j \leq 85^\circ\text{C}$		1	6	$\mu\text{A}$
$V_{VDD\_POR\_H}$	POR high threshold	VDD increasing	2.5		3.1	V
$V_{VDD\_POR\_L}$	POR low threshold	VDD decreasing	2.3		2.9	V
<b>LOGIC CONTROL INPUT (EN, NCS, SDI, SCK)</b>						
$V_{IL}$	Input logic low voltage				$0.3^*V_D$	V
$V_{IH}$	Input logic high voltage		$0.7^*V_D$			V
$V_{HYS}$	Input logic hysteresis			0.5		V
$R_{PD}$	Pulldown resistance	EN, SDI, SCK	50	100	150	$\text{k}\Omega$
$R_{PU}$	Pullup resistance	NCS	50	100	150	$\text{k}\Omega$
$C_{IN}$	Input capacitance	NCS, SDI, SCK pin, Specified by design			15	$\text{pF}$
$T_{\text{Deglitch}}$	Deglitch filter on EN falling and rising			10	20	$\mu\text{s}$
$T_{\text{WAKE}}$	Wake-up time	After EN low to high			150	$\mu\text{s}$
<b>NFAULT OUTPUT (OPEN DRAIN)</b>						
$V_{OL\_nFault}$	Output low voltage	$I_{OD} = 5\text{mA}$			0.5	V
$I_{LEAK\_nFault}$	Output high leakage current	$V_{OD} = 5\text{V}$	-1		1	$\mu\text{A}$
<b>SDO OUTPUT (PUSH PULL)</b>						
$V_{OL\_SDO}$	SDO Output low voltage	$I_O = 2\text{mA}$			0.5	V
$V_{OH\_SDO}$	SDO Output high voltage	$I_O = 2\text{mA}$	$VDD - 0.5$			V
$I_{LEAK\_SDO}$	SDO tristate leakage	$NCS \text{ high}, 0 < V_{SDO} < VDD$	-1		1	$\mu\text{A}$
$C_{OUT}$	Output capacitance	Specified by design			30	$\text{pF}$
<b>HALF BRIDGE OUTPUTS (OUT1-OUT10)</b>						

$R_{DS(ON)}$	High-side or Low-side FET on resistance	$I = 0.5 \text{ A}, T_j = 25^\circ\text{C}$		0.75	1.2	$\Omega$
		$I = 0.5 \text{ A}, T_j = 150^\circ\text{C}$			1.6	$\Omega$
$I_{LEAK_HS}$	HS OFF-state leakage	$V_{OUTx} = 0\text{V}, EN = 1$	-2	-1	-	$\mu\text{A}$
		$V_{OUTx} = 0\text{V}, EN = 0$	-2	-1	-	$\mu\text{A}$
$I_{LEAK_LS}$	LS OFF-state leakage	$V_{OUTx} = 13.5\text{V}, EN = 1, -40 \leq T_j \leq 85^\circ\text{C}$	-	1	5	$\mu\text{A}$
		$V_{OUTx} = 13.5\text{V}, EN = 1, -40 \leq T_j \leq 150^\circ\text{C}$	-	1	10	$\mu\text{A}$
		$V_{OUTx} = 13.5\text{V}, EN = 0, -40 \leq T_j \leq 85^\circ\text{C}$	-	1	5	$\mu\text{A}$
		$V_{OUTx} = 13.5\text{V}, EN = 0, -40 \leq T_j \leq 150^\circ\text{C}$	-	1	10	$\mu\text{A}$
$t_{RISE}$ $t_{FALL}$	Output rise time Output fall time High side or low side	$VM = 13.5 \text{ V}, \text{ resistive load } 100 \text{ ohm}, HBx\_SR = 0$		0.6		$\text{V}/\mu\text{s}$
		$VM = 13.5 \text{ V}, \text{ resistive load } 100 \text{ ohm}, HBx\_SR = 1$		2.5		$\text{V}/\mu\text{s}$
$t_{PD}$	Propagation delay (high side / low side ON/OFF)	$HBx\_SR = 0$		16		$\mu\text{s}$
		$HBx\_SR = 1$		7		$\mu\text{s}$
$t_{DEAD}$	Cross protection time, high to low / low to high	$HBx\_SR = 0$		28		$\mu\text{s}$
		$HBx\_SR = 1$		7		$\mu\text{s}$

**OVERCURRENT PROTECTION**

$I_{OC}$	Over current threshold	Half bridge low side	1		1.6	A
		Half bridge high side	-1.6		-1	A
$t_{OC}$	OC deglitch filter time	OC_Filter bit = 000		10		$\mu\text{s}$
		OC_Filter bit = 001		5		
		OC_Filter bit = 010		2.5		
		OC_Filter bit = 011		1		
		OC_Filter bit = 100		60		
		OC_Filter bit = 101		40		
		OC_Filter bit = 110		30		
		OC_Filter bit = 111		20		

**ON STATE OPEN LOAD DIAGNOSIS**

$I_{OL}$	Open load threshold	Half bridge low side, $HBx\_OPL\_TH = 0$	1.5	10	26	mA
----------	---------------------	--	-----	----	----	----

		Half bridge high side, HBx_OPL_TH = 0	-26	-10	-1.5	mA
$t_{OL}$	Open load filter time	HBx_OPL_TH = 0, guarantee by digital scan	2	3	4	ms
$I_{OL\_LOW}$	Low open load threshold	Half bridge low side, HBx_OPL_TH = 1	0.1	1	2.5	mA
$t_{OL\_LOW}$	Low open load filter time	HBx_OPL_TH = 1, guarantee by digital scan	0.2	0.3	0.4	ms

**OFF STATE OPEN LOAD DIAGNOSIS**

$I_{PU}$	Diag pull up current	HBx_IPUPD_MODE = 0	133	200	320	$\mu A$
	Diag pull up current	HBx_IPUPD_MODE = 1	666	1	1.5	mA
$I_{PD}$	Diag pull down current	HBx_IPUPD_MODE = 0	400	600	900	$\mu A$
	Diag pull down current	HBx_IPUPD_MODE = 1	2	3	4.5	mA
$V_{STA\_HB}$	Off state status threshold	OUTx pin	0.54* VDD	0.6* VDD	0.66* VDD	V

**THERMAL PROTECTION**

$O{T}_{WARN}$	Thermal warning temperature		120	140	160	$^{\circ}C$
$T_{HYS\_OTW}$	Thermal warning hysteresis			20		$^{\circ}C$
$O{T}_{SD}$	Thermal shutdown temperature		150	170	190	$^{\circ}C$
$T_{HYS\_OTSD}$	Thermal shutdown hysteresis			20		$^{\circ}C$

**SPI AC TIMINGS**

$T_{cll}$	Minimum time CLK = LOW (5)	Application info	85			ns
$T_{clh}$	Minimum time CLK = HIGH (4)	Application info	85			ns
$T_{pcld}$	Propagation delay (SCLK to data at SDO active) (B)	Cload=30pF			30	ns
$T_{lead}$	CLK change L/H after NCS = LOW (2)	Application info	100			ns

$T_{scld}$	SDI input setup time (CLK change H/L after SDI data valid) (F)	Application info	30			ns
$T_{hcld}$	SDI input hold time (SDI data hold after CLK change H/L) (C)	Application info	30			ns
$T_{sclch}$	CLK low before NCS low (1)	Application info	125			ns
$T_{lag}$	CLK low before NCS high (6)	Application info	100			ns
$T_{hchlch}$	CLK high after NCS high	Application info	100			ns
$T_{onncs}$	NCS min high time (9)	Application info	1			$\mu\text{s}$
$T_{pchdz}$	NCS L/H to SDO @ high impedance (E)	Cload=30pF			75	ns
$F_{\text{CLK\_SPI}}$	CLK frequency (50% duty cycle)	Application info			5	MHz

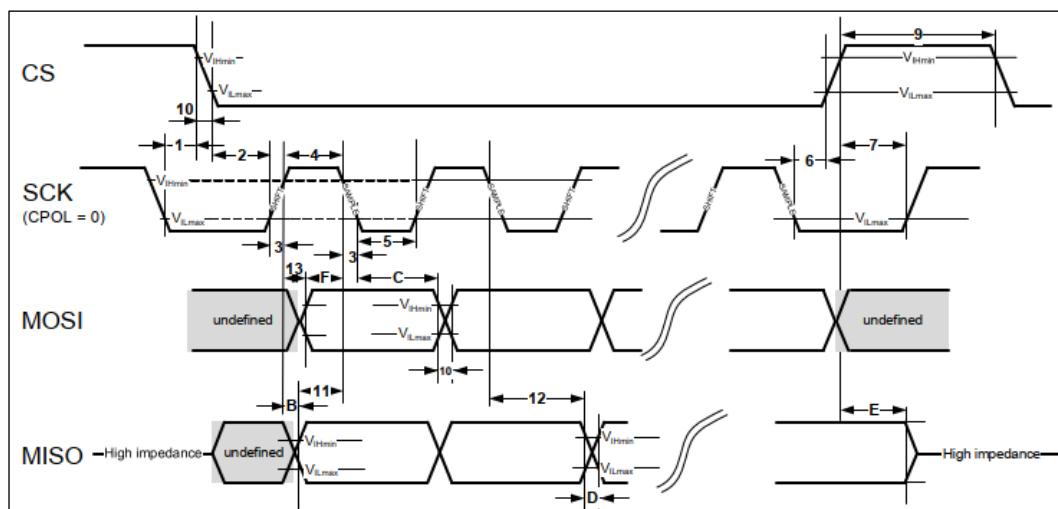

Figure 3. SPI timing diagram

## 7. Functional Description

### 7.1. VM & VM UV / OV Protection

VM is the supply voltage, range from 4.5V to 36V with typical case 13.5V power supply. It is recommended to put at both 100nF ceramic and  $>10\mu\text{F}$  bulk electrolytic capacitor closed to each VM pin.

When VM power supply pin voltage falls below the undervoltage threshold (VUV) over  $10\mu\text{s}$  typ. undervoltage deglitch time, half bridge outputs OUTx becomes OFF. When VM rise above the VUV, the device automatically resumes operation.

When VM power supply pin voltage rises above the overvoltage threshold (VOV) over  $10\mu\text{s}$  typ. overvoltage deglitch time, half bridge outputs OUTx becomes OFF. When VM decrease under the VOV, the device automatically resumes operation. OVP\_H register bit set the two different VM input overvoltage threshold.

### 7.2. VDD

VDD pin accepts wide supply range from 3V to max 5.5V which intends for the compatibility with both 3.3V and 5V system supply. 100nF X7R ceramic capacitor is suggested to put closed to VDD pin.

Internal block, SPI interface, digital block will be inactive when VDD drops below VDD\_POR\_L, so including charge pump and all half bridge drivers are switched off. Once VDD > VDD\_POR\_H, internal digital is reset, and status register NPOR bit is set to 0 and can be cleared to 1 by SPI readout (if RD\_CLR\_EN=1) or CLRFLT = 1 command.

### 7.3. EN Input

The EN pin signal is common for all output channels. When it is driven low, internal logic / register is reset, charge pump / all outputs are disabled, and device enter sleep mode.

After EN transition from low to high at VDD > VDD\_POR\_H, device come out sleep mode at finishing internal POR and NPOR=0.

A TWAKE time shall be wait for charge pump reach regulated voltage once device move from sleep to normal operation.

### 7.4. Half Bridge Output Stage, OUT1 ~ OUT10

The half bridge drivers are designed to drive DC motor or general used inductive/resistive load like LED.

The power stage outputs (out1~out10) can be in parallel to support higher load current.

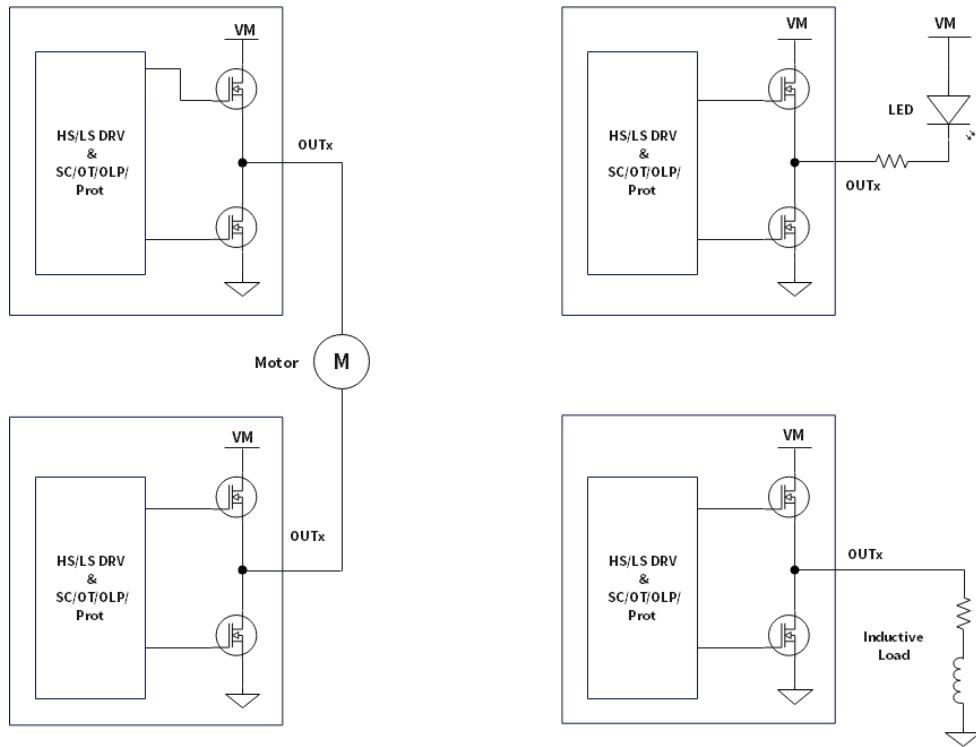

Figure 4. Power Stage Output Block Diagram

#### 7.4.1. SPI Control ON/OFF Operation

To directly operate half bridge output by only SPI ON/OFF control, the two group register as below shall be controlled in following steps.

1. HBx\_PWM\_EN bit configuration in register HB\_PWM\_CTRL1 and FW\_PWM\_CTRL\_2
2. HBx\_HS\_EN or HBx\_LS\_EN bit configuration in register HB\_CTRL1 / HB\_CTRL2 / CTRL3

Note:

- HBx\_PWM\_EN bit shall be configured or keep default value '0' for SPI control ON/OFF operation
- One specific half bridge, HBx\_HS\_EN and HBx\_LS\_EN shall not be '1' at the same time, otherwise, the specific half bridge will be HIZ until this same bridge HS and LS control bit both high condition is removed

Example of activation of HB1\_HS / HB1\_LS and HB2\_HS / HB2\_LS to drive motor by SPI control as table 2 shown

**Table 2. Half bridge SPI control register setting example**

EN	HB1 register setting	HB2 register setting	OUT1	OUT2
LOW	x	x	HIZ	HIZ
High	HB1_PWM_EN=0 HB1_HS_EN=0 HB1_LS_EN=0	HB2_PWM_EN=0 HB2_HS_EN=0 HB2_LS_EN=0	HIZ	HIZ
High	HB1_PWM_EN=0 HB1_HS_EN=1 HB1_LS_EN=0	HB2_PWM_EN=0 HB2_HS_EN=0 HB2_LS_EN=1	High	Low
High	HB1_PWM_EN=0 HB1_HS_EN=0 HB1_LS_EN=1	HB2_PWM_EN=0 HB2_HS_EN=0 HB2_LS_EN=1	Low	Low
High	HB1_PWM_EN=0 HB1_HS_EN=0 HB1_LS_EN=1	HB2_PWM_EN=0 HB2_HS_EN=1 HB2_LS_EN=0	Low	High
High	HB1_PWM_EN=0 HB1_HS_EN=1 HB1_LS_EN=0	HB2_PWM_EN=0 HB2_HS_EN=1 HB2_LS_EN=0	High	High

#### 7.4.2. PWM Control Operation

PWM control is based on internal digital PWM generator and map control block. It is suggested to set following registers

- PWM frequency / duty cycle / map control

(1) PWMx\_FREQ bit in PWM\_FREQ\_CTRL1 / PWM\_FREQ\_CTRL2 registers

Total 8 PWM generator, 2bit configuration for each PWM freq as (80Hz / 100Hz / 200Hz / 2000Hz) in +/-30% variation for full operating and temperature range.

(2) PWMx\_DUTY\_CYCLE bit in PWM\_DC\_CTRL1~PWM\_DC\_CTRL8 registers

8bit configuration of PWMx\_DUTY\_CYCLE define the duty cycle of generated PWMx as 100%\*BIT value /255

(3) HBx\_PWM\_MAP bit in PWM\_MAP\_CTRL1~PWM\_MAP\_CTRL6 registers

3bit for each Half bridge, which allows independent and flexible selection from PWM1~PWM8

- Half bridge driver setting for PWM

(1) HBx\_PWM\_EN bit in HB\_PWM\_CTRL1, FW\_PWM\_CTRL2

HBx\_PWM\_EN bit changed to '1' will enable the selected half bridge operation control by mapped PWM

(2) HBx\_HS\_EN / HBx\_LS\_EN in HB\_CTRL1~HB\_CTRL3

Set HBx\_HS\_EN or HBx\_LS\_EN bit at '1' to enable the PWM activated Power FET stage.

- Active / passive freewheeling setting in PWM

(1) HBx\_FW bit in FW\_CTRL\_1, FW\_PWM\_CTRL\_2 registers

When the particular half bridge channel is chosen to use PWM, it is also possible to select the active or passive freewheeling option for the half bridge channel, by HBx\_FW control bit.

Example of active HB1 SPI ON and HB2 LS in PWM mode / HB2 HS in passive or active freewheeling to drive motor / inductive load

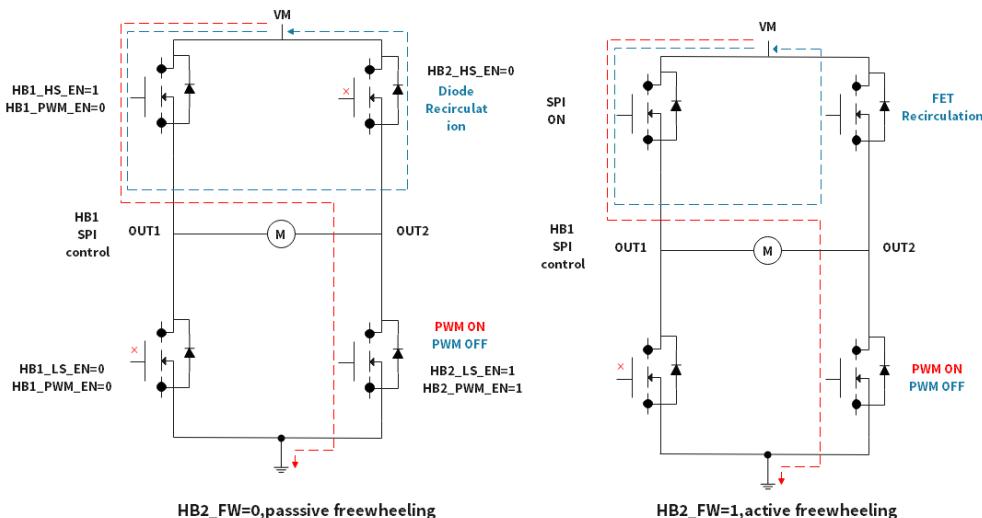

Figure 5. Passive freewheeling vs. active freewheeling

Note:

- Active freewheeling function automatically turns on the freewheeling FET, after the driving FET turns off at PWM ON->OFF and cross protection time tDEAD elapsed
- HBx\_FW bit value is not effective when HBx\_PWM\_EN bit is configured as SPI control ON/OFF

- PWM enable / disable
    - (1) PWM<sub>x</sub>\_DIS bit in HB\_PWM\_CTRL2
    - PWM channel independent enable / disable bit
- 

Example of PWM mode control register setting and steps

1. Configure PWM<sub>x</sub>\_DIS bit into '1' (PWM stopped and off) for selected PWM channel
  2. Configure active or passive free-wheeling in FW\_CTRL register
  3. Assign the PWM channel for selected half-bridge output in PWM\_MAP\_CTRL register
  4. Configure the PWM frequency in PWM\_FREQ\_CTRL register
  5. Configure the PWM duty cycle in PWM\_DC\_CTRL register
  6. Assign the channel driven mode SPI on/off or PWM operation by HB<sub>x</sub>\_PWM\_EN in HB\_PWM\_CTRL register
  7. Select the channel HS or LS to be driven by HB<sub>x</sub>\_HS\_EN or HB<sub>x</sub>\_LS\_EN in HB\_CTRL register
  8. Active and begin the PWM by PWM<sub>x</sub>\_DIS bit to '0'
- 

### 7.4.3. Output in Parallel

For SPI ON/OFF control in parallel, it is recommended to select half bridge channel in same register, is HB1, HB2, HB3, HB4 HS / LS control bit are all in HB\_CTRL\_1 register, while HB5, HB6,HB7,HB8 are in HB\_CTRL\_2, while HB9, HB10,HB11,HB12 are in HB\_CTRL\_3.

For PWM control in parallel, to ensure the HS or LS activated simultaneously, it is mandatory to put the PWM activation in the last step for PWM mode control register setting.

## 7.5. Half bridge Protection and Diagnosis

### 7.5.1. Overcurrent Protection

The integrated overcurrent protection function provides the half bridge high side against short to ground or half bridge low side against short to battery.

When the current pass the half bridge high side (VM->highside->OUTx) or flow into the half bridge low side (OUTx->low side->GND), once IOC overcurrent threshold is exceeded, an overcurrent deglitch filter tOC starts and internal circuit limits current at ILIM.

Upon the overcurrent condition last until tOC expiration, the particular half bridge (including high side and low side) is disabled. The OC status bit shall report the corresponding HS or LS which trigger OC. nFAULT pin also asserts low if OC\_MASK\_FLT is set '0'.

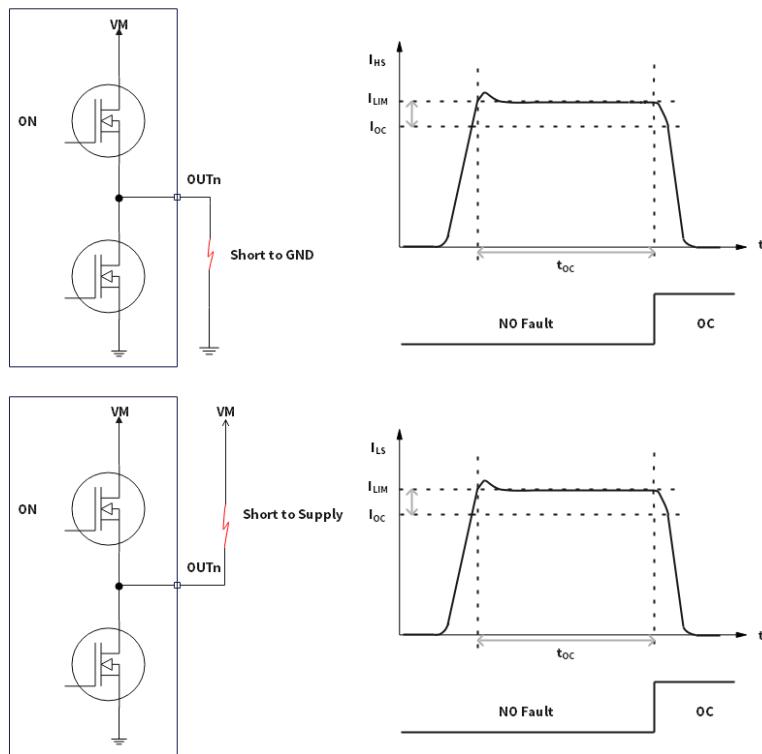

For example, if only HB1 LS is short to battery and detected, OC\_STA\_1 register HB1\_LS\_OC bit is asserted while HB1\_HS\_OC bit not affected, for output stage, both HB1 HS and LS are disabled.

To resume normal driving, besides the overcurrent condition disappear, it is also required to clear the OC status bit by SPI reading (RD\_CLR\_EN=1) or writing DIAG\_CLR bit '1' to trigger clear fault command.

---

Note:

1. Even the half bridge output is disabled due to overcurrent protection mechanism, the HBx\_HS\_EN or HBx\_LS\_EN bit remains previous state, unless user change the value through SPI.
  2. During overcurrent fault handling process, it is suggested to first reset the HBx\_HS\_EN or HBx\_LS\_EN bit to 0, then clear the OC status bit by SPI command, the last is to re-enable HBx\_HS\_EN or HBx\_LS\_EN bit. For example, HB1 previous state is HS ON and HS OC, so the procedure of HB1 OC fault handling is first writing HB1\_HS\_EN bit =0, then sending DIAG\_CLR '1' to clear HB1 OC fault, the last is to set HB1\_HS\_EN=1 to enable HB1 HS again.
  3. When device operate in high voltage (e.g. > 28V), short tOC (OC\_Filter bit in OPL\_OC\_CTRL3 register) is suggested.
-

**Figure 6. High-Side Switch and Low-Side Switch - Short Circuit and Overcurrent Protection**

Anyhow if overcurrent condition short than  $t_{OC}$  deglitch filter, the OC event is not confirmed, and HB driver keeps normal status.

The device also provides two slew rate options in case half bridge output stage turn off caused by OC protection. High slew rate turns off (typ 2.5v/ $\mu$ s) used in default for OC as OC\_OFF\_SR bit in OPL\_OC\_CTRL\_3 is set to '0', while slow slew rate turns off in OC condition (OC\_OFF\_SR=1) shall be carefully evaluated for device operating ambient condition and power dissipation.

#### 7.5.2. Open load in ON state

The load current is monitored in each activated output stage for open load detection in ON state.

If the load current is below open load detection threshold  $I_{OL}$  for at least typ.3ms ( $t_{OL}$ ), the corresponding open load bit is set in status register.

The device also provide HBx\_OPL\_TH selection bit for lower open load threshold  $I_{OL\_LOW}$  and the corresponding filter time  $t_{OL\_LOW}$ , which targets for low current loads ie. LED.

Furthermore, two bits, OPL\_HB\_ACT bit and OPL\_mask\_FLT bit in OPL\_OC\_CTRL\_2 register, can be configured for open load fault reaction.

- OPL\_HB\_ACT bit determines whether half bridge output status is impacted by ON state open load fault. Default value '0' will disable faulty half bridge HS and LS, while setting the bit value to '1' can choose open load only as information flag and half bridge control / operation not impacted.

- OPL\_mask\_FLT bit determines whether nFault output pin status is impacted by ON state open load fault. Default value '0' unmasks and generates nFault low at open load detected, while changing to '1' will mask open load fault and doesn't report on nFault output.

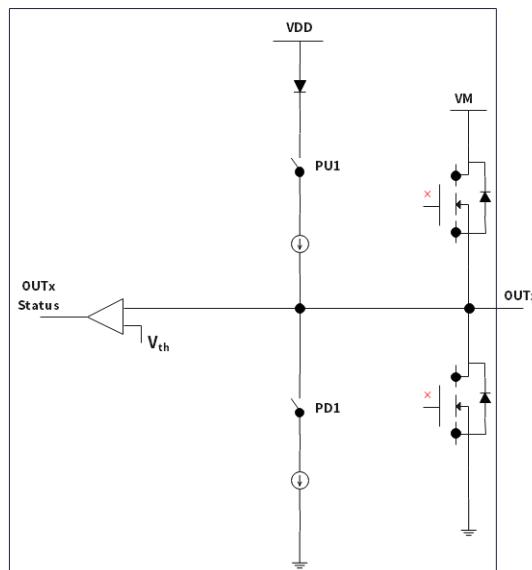

User can clear the OL status bit by SPI reading (RD\_CLR\_EN=1) or writing DIAG\_CLR bit '1' to trigger clear fault command to determine whether open load is still present or disappeared.

Note:

1. For DC motor application, it is recommended to use SPI ON/OFF short activation of outputs (e.g. 4ms) to test DC motor open load status without changing the mechanical state of motor.
2. For LED load application, PWM control might be used, the lower open load threshold and shorter filter shall be chosen. During PWM OFF/freewheeling state, open load detection is blanked.
3. Additionally, the low open load threshold function for LED application is implemented only on low-side. The user has to enable the low current open load mode for the corresponding low-side and connect the LED load in low side proper operation way.
4. Each half bridge ON state open load detection can be disabled by HBx\_OPL\_DIS bit in OPL\_CTRL\_1/2 register, in case ON state open load diagnosis is not required.

### 7.5.3. OFF-state Diagnosis

Each half bridge OUTx integrates internal pull-up current / pull-down current and comparator for off-state diagnosis as figure 7 shown.

**Figure 7. Half – Bridge diagnosis OFF-STATE**

Pull up current or pull down current are individually controlled as enable / disable by register OPL\_CTRL\_5 and OPL\_CTRL\_6 bit setting values.

The OUTx pin voltage is compared with VSTA\_HB to determine its off-state logic status (HIGH or LOW) in real time and reported in HB\_STA1 register.

Note:

- NSD8310 can be used in various load connection topologies, Half bridge/H-bridge/LS/HS connection. To diagnosis the OUTx external connection status (normal, short to battery, short to ground, open load), it is suggested to follow the off-state diagnosis step of NSD8310 application note / FAQ document and run the recommended the pull-up / down current enable/disable sequence to read back the OUTx pin voltage status combination using microcontroller.

#### 7.5.4. Overtemperature

To protect power stage from overheat, dedicated thermal sensor is placed close to each half bridge power stage, if the temperature increases above the OTwarn, a temperature warning flag is set in SPI STA\_0 register, half bridge output operation is not impacted. Once the sensed temperature over the second OTSD threshold, the corresponding OTSD flag is set and power MOSFET channel is automatically disabled.

nFAULT pin can be configured for OTwarn event report upon OTW\_MASK\_FLT bit setting. Anyhow OTSD will always asserted nFAULT to low.

OTwarn and OTSD flag bit are latched until cleared by SPI command, while the output stage is automatically reactive after the temperature drops below OTSD-THYS and nFAULT pin is released.

### 7.5.5. Fault Protection Summary

EVENT	VM			VDD	EN	Thermal		Load current		
	OV1 t>tov	OV2 t>tov	UV	UV	H>L	OVER TEMPERATURE Warning	OVER TEMPERATURE shutdon	OC	OL in ON	
	SPI CTRL_0 register OVP_H bit					OTW_MASK_FLT		OC_MASK_FLT	OPL_HB_ACT OPL_mask_FLT	
FLAG READ BY SPI	VM_OV	VM_OV	VM_UV	NPOR		OTWARN	OTSD	HBx_HS_OC HBx_LS_OC	HBx_HS_OPL HBx_LS_OPL	
Internal supply	○	○	○	▲	▲	○	○	○	○	
Internal OSC	○	○	○	▲	▲	○	○	○	○	
Charge pump	○	○	▲	▲	▲	○	○	○	○	
OUT1~OUT12	▲	▲	▲	▲	▲	○	▲	▲*1	▲*2 *1	
nFault	△	△	△	-	-	△*3	△	△*4	△*5	
SPI communication	○	○	○	▲	▲	○	○	○	○	
SPI REGISTERS	○	○	○	▲	▲	○	○	○	○	
x	detection			*1		The fault output off state, caused by OC or OL in ON, is latched until the corresponding restart condition is met.				
○	normal operation			*2		On state open load switch off the corresponding HB channel both HS and LS output, if OPL_HB_ACT bit =0.				
-	not active			*3		OTW_MASK_FLT =1 means that overtemperature warning triggers nFAULT low				
●	partial functionality			*4		OC_MASK_FLT=0 unmasks and report on nFAULT if OC happens				
▲	stop/reset			*5		OPL_mask_FLT=0 unmasks and report on nFAULT if Open load on state detected				
△	active LOW									

## 7.6. SPI Interface

The following table summarizes the SPI interface designed.

**Table 55 – SPI Interface quick look**

Parameter	Description
Protocol	in frame
Single Frame Length	16 bit, MSB first
Frame protection	frame length check
Max. Frequency	5 MHz
CPOL	0
CPHA	1
Master/Slave configuration	Slave

The falling edge of NCS defines the start of the SPI frames. It samples the SDI line at the falling edge of SCK, while the output data is shifted out on SDO line at the rising edge of SCK (CPOL='0' CPHA ='1').

The end of SPI frame is defined by a rising edge of NCS.

### 7.6.1. Frame Length Check

For each command received, the SPI peripheral checks the number of clock edges at SCK pin. If the total number of edges is not a multiple of 16, the frame content is discarded and an SPI\_ERR bit will be returned upon next iteration.

### 7.6.2. Error Frame

In case one of the following error occurs, the SPI\_ERR diagnosis bit will be returned upon next communication iteration:

- Frame Length error
- Invalid address

### 7.6.3. SPI Frame Structure

Each SDI input frame has 16 bits with the following structure:

- 2 operation command bit C1 / C0 ‘00’ for write operation, ‘01’ for read operation
- 6 ADDRESS bits
- 8 DATA bits

	MSB									LSB
BIT	15	14	13	12	11	10	9	8	[7:0]	
SDI	C1	C0	A[5]	A[4]	A[3]	A[2]	A[1]	A[0]	DATA	

Register frame SDO responses the selected address and register content bit values. It has with the following structure:

- 2bit '1', reserved
- 6bits, UV event / OV event , Overtemperature, NPOR and power stage status OC, OL
- 8 DATA bits

	MSB									LSB
BIT	15	14	13	12	11	10	9	8	[7:0]	
SDO	1	1	OT	OL	OC	UV	OV	NPOR	DATA	

Note:

For SPI write operation, the SDO response data is the value which is currently written to.

For SPI read operation, the SDO response data is the value which register address has been read.

#### 7.6.4. Parallel and Daisy Chain Capability

SPI communication between microcontroller (SPI master) and multiple these devices (slave) can be operated in parallel or in daisy chain.

Parallel operation: several slave devices are connected to one SPI channel, which share communication lines SDI, SDO and SCK, but every slave connects dedicated own NCS.

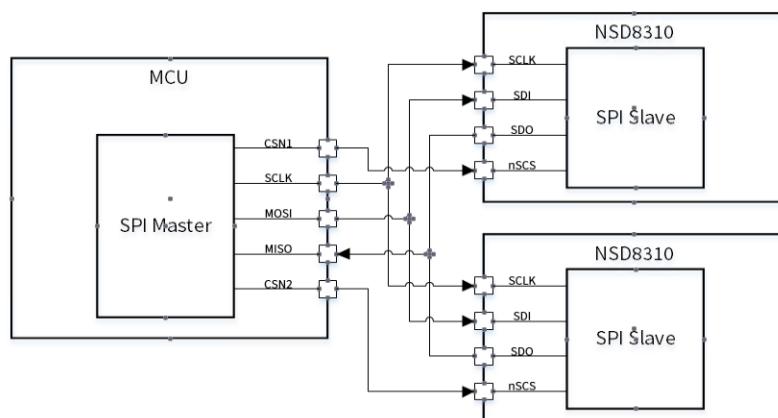

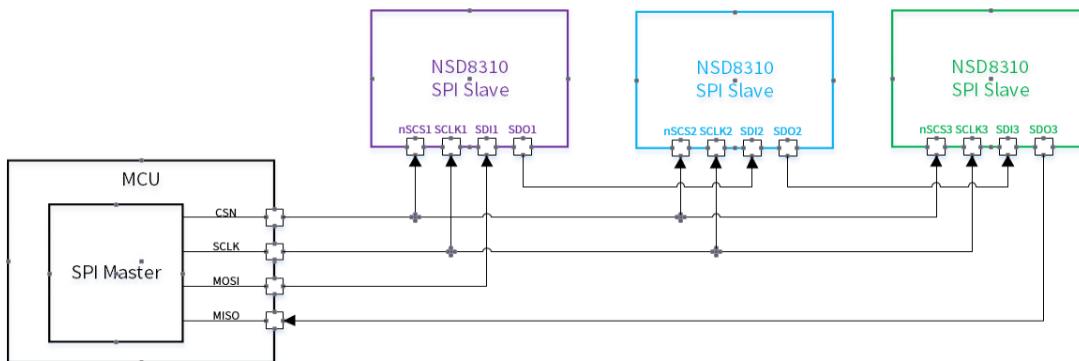

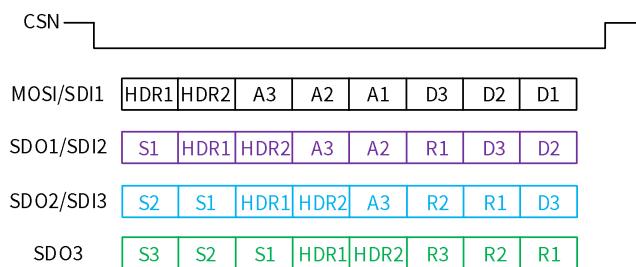

Figure 8 Without daisy chain, in parallel operation diagram

Daisy chain operation: multi devices are connected with shared one NCS and SCK, while each device SDI and SDO are daisy-chain connected. An example of 3 devices in daisy chain as below figure 9:

**Figure 9 Daisy Chain Operation for 3 Devices**

The SPI format for daisy chain SPI operation as below, A1~A3, D1~D3, S1~S3, R1~R3 have same meaning/definition with single device operation described

**Figure 10 SPI Format for 3 Devices Daisy Chain**

There are two header bytes dedicated for daisy chain operation

- HDR1 byte contain information of the number of devices connected in the chain by N0~N5 bits, so device support up to 63 devices, other bits are fixed
- HDR2 byte contain CLR bit which can trigger SPI clear command for all device in daisy chain, other bits are fixed (bit7 and bit6) or not care(bit0~bit4)

HDR1	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
	1	0	N5	N4	N3	N2	N1	N0

HDR2	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
	1	0	CLR	X	X	X	X	X

**Figure 11 Daisy Chain Header Bytes Format**

Note: Internal logic will count number of status bytes it receives before HDR1 and HDR2 to know the position of itself in the chain, also by HDR1 it knows how many devices in the chain, so it only loads the relevant address and data byte in its buffer and bypass the other bytes.

7	Reversed	Reserved, '000000' shall be used
6		
5		
4		
3		
2		
1	HB10_STA	0: HB10 output voltage status low (<Vth) 1: HB10 output voltage status high(>Vth)
0	HB9_STA	0: HB9 output voltage status low (<Vth) 1: HB9 output voltage status high(>Vth)

**Table 7.6.19 GEN\_CTRL\_0 control register (REG\_ADDR = 0x07)**

	D7	D6	D5	D4	D3	D2	D1	D0
Field Name	OFF_DIAG_COMP_EN		DEVICE_ID		OC_MASK_FLT	OTW_NMASK_FLT	OVP_H	DIAG_CLR
Operation Type	RW		RO		RW	RW	RW	WO
Default	0		Device related		0	0	0	0

**Table 7.6.20 GEN\_CTRL\_0 control register description**

Bit	Field Name	Description

7	OFF_DIAG_COMP_EN	0: all half bridge OFF state diagnosis comparators are disabled; and comparator output keeps default value 0 (default value) 1: all half bridge OFF state diagnosis comparators are enabled
6	DEVICE_ID	100 = NSD8306 101 = NSD8308 110 = NSD8310 111 = NSD8310 others reversed
5		
4		
3		0: overcurrent unmasked, reported on nfault (default value) 1: overcurrent event is masked, not reported on nfault
2	OTW_NMASK_FLT	0: overtemperature warning masked, not reported on nfault (default value) 1: overtemperature warning unmasked, reported on nfault
1	OVP_H	0: VM overvoltage voltage threshold at >21V (default value) 1: Higher overvoltage protection threshold, VM up to >32V
0	DIAG_CLR	0: no action - clear all fault (default value) 1: Trigger action - clear all fault Note: DIAG_CLR bit is auto clear bit and always read as '0'. Every time writing '1' triggers single pulse to clear diagnosis result.
